WHAT IS THE ICT-101?

The ICT-101* from MICRO SCIENCES, INC. is a low cost, portable, Integrated Circuit Tester designed to functionally test digital logic IC's installed on a circuit board and under power. (Stand alone IC's may also be tested using the OBT/4 option.)

The ICT-101 identifies the generic IC number and at the same time, displays the test results. For example:

"7402 GOOD" for TTL or
"74C02 GOOD" for CMOS or
"UNIDENTIFIED/BAD"

The Standard ICT-101's Dictionary contains test signatures of many popular TTL and CMOS 14, 16, 20 and 24 Pin digital IC's. Presently, the Standard Dictionary permits over 175 industry standard IC's to be tested "On the Board Under Power". When basic technologies; such as: L (Low Power), LS (Low Power Schottky), S (Schottky), ALS (Advanced Low Power Schottky), HC (High Speed CMOS) and H (High Speed) are considered, all of which the ICT-101 tests, the Standard Dictionary capability is expanded accordingly. Thus, the number of IC's the ICT-101 Standard Dictionary can test is well over 1,000. Furthermore, the Dictionary includes functions of military grade equivalents (e.g. DM5400) of commercial grade IC's (e.g. DM7400).

The ICT-101 also identifies standard IC's used in certain (see Appendix 5.5) non-standard applications (e.g. certain gates disabled).

Options include a ROM and/or RAM test and general as well as customer specified Dictionary expansions for standard 14, 16, 20 and 24 Pin IC's.

Special options include the OBT/4 which tests loose 14, 16, 20 and 24 Pin IC's under power and the EDP/1 which tests the exact configuration of IC's on specific popular printed circuit boards. External Dictionary expansions are also available.

Optional accessories include a 24 Pin Test Clip and Cable and a 16 Pin Test Clip and Cable for high density situations.

Presently, the various dictionaries normally permit 60% to 90% of all standard configuration digital TTL and CMOS IC's in use today to be tested "On the Board". Additional IC's for "On the Board" tests are included in the various Expansion Options (see Appendix 5.4), the ICT-101 does not test linear IC's, PAL's, one (1) shots and unstable devices.

1. GENERAL

1.1 UNPACKING AND INSPECTION

Every precaution has been taken to insure that your ICT-101 reaches you in fully operational condition. If there is any damage to the container, the unit and its container should be returned to the SHIPPER and Micro Sciences should be contacted immediately (see Maintenance and Support Service, Appendix 5.2).

Upon unpacking, inspect the unit (keep carton, foam insets and plastic bag in the event that the unit has to be returned to Micro Sciences) for any obvious physical damage; such as: broken fuse holder, switches, etc. IN PARTICULAR, examine the display to insure that it is not broken. If any damage is evident, DO NOT PLUG in the unit. Return it to Micro Sciences immediately (see Appendix 5.2) for repair or replacement.

1.2 SAFETY

Observe normal safety procedures for electrical equipment when connecting the ICT-101 to AC power. The unit is wired internally for 120V AC (unless otherwise requested).

Note that fuses should be replaced ONLY with good fuses of the specified value. Installation of a higher value fuse will void your warranty.

1.3 CARE AND MAINTENANCE

All power connections should be kept in good condition away from excessive heat sources and petroleum products. Always replace worn or damaged cables. The test cable will be the most USED and ABUSED part of the unit. Using the test cable and clip in the manner intended will insure proper functioning of the tester. The tester requires no periodic maintenance.

1.4 SPECIFICATIONS

A. Electrical Specifications:

Display:	16 character dot matrix LCD
Front Panel:	Power On/Off indicator light Ready indicator light "GO" button to initiate test "SELECT" button to change mode (e.g. TTL to CMOS) "RESET" button "RAM" button "ROM" button
Test Sockets:	J1: 20 Pin Cable Assembly IC Test Clip (tests 14, 16 and 20 Pin IC's) NO Pin #1 orientation necessary. J2: 24 Pin Cable Assembly (optional).
Common Ground Socket:	Same ground as PC Board under test
Maximum VCC:	(For board under test) +5 volts DC (+ or - 10%)
Overload Protection:	AC 1/4 AMP instantaneous Fuse (external) DC 3 AMP instantaneous Fuse (internal)
Threshold Voltage:	0/ +.8 and +3.5/ 5.0 Volts
Power Requirements:	120 (+ or - 10) VAC, 50 to 60 Hz (no selection necessary) 25 watts Strap options for 100, 220, 240 VAC, 47 to 63 Hz

B. Environmental Specifications:

Operating Ambient
Temp Range: +32F to +100F

Storage Temp. Range: -20F to +120F

C. Physical Specifications:

Size (HWD): 5.01" x 12.5" x 11.63"

Weight: 7.63 lbs.

1.5 WARRANTY

All components used in all ICT-101's are of the highest commercial grade available. Furthermore, each ICT-101 is subject to a very rigid acceptance test program during and after assembly and prior to shipment. Nevertheless, as with all components and equipment, there could be a small percentage of failure.

To the ultimate user, the ICT-101 is warranted against failure due to faulty materials or workmanship for a period of 90 days from the date of shipment. The warranty covers parts and labor to repair or replace defective parts at the factory, provided the unit has been returned by the user and the Warranty Registration Card is on file at Micro Sciences, Inc.

The above warranty is void if the ICT-101 has been modified by the customer, or if it has been abused or operated outside its electrical or environmental specifications.

To the original commercial purchaser, Micro Sciences extends a one (1) year warranty on all ICT-101 parts with the specific exception of the LCD display, display drivers, the power supply, the case, the power cable and the test cable and clips.

For as long as the ICT-101 remains in the possession of the original purchaser, Micro Sciences will provide replacement parts for any other failed parts other than the LCD display, display drivers, the power supply, the case, the power cable and the test cable and clips. Such replacement parts will be sent, on written request, to the owner for owner's installation. Under NO circumstances will Micro Sciences be responsible for more than the cost of the failed part.

This warranty is limited solely to the above equipment and this warranty and any warranties implied by State Law will apply only for the period set forth. The warrantor will not be liable for any loss, damage, incidental or consequential damages of any kind, whether based upon warranty, contract or negligence, and arising in connection with the sale, use or repair of the product. Unless contrary to State Law governing the purchase, the warrantor's liability shall not, in any case, exceed the contract price for the product claimed to be defective or unsuitable.

Prior to return of any unit for any reason, Micro Sciences must be notified (1-800-527-7141). A return authorization number will be issued and will appear on all packing lists, correspondence and the shipping label.

Units for factory inspection should be shipped via prepaid freight to Micro Sciences, Inc., 1095 S. I-45, Hutchins, Texas 75141 (Attn: Receiving/Shipping).

Should the factory inspection determine that defects are covered under the warranty, the customer will receive credit for incoming freight expense and the return of repaired units will be at Micro Sciences' expense. Units will be shipped (if possible) from the factory within twelve (12) working days of receipt of the defective unit. Out of warranty units or units modified or abused by customers will be invoiced for parts and labor and will be returned at customer's expense within a reasonable time.

Extensive care has been taken in designing, manufacturing and testing this unit. Proper use of this equipment will insure many years of satisfactory service.

2.2 Back Panel Layout

* OBT/4 POWER NOT FOR OTHER USE OR WARRANTY INVALIDATED.

2.3 REMOVAL OF COVER

The cover of the ICT-101 should be removed ONLY for the purpose of inspecting and replacing the Internal Fuse with one of the same value (see Section 1.4).

Any other operations inside the ICT-101 are strongly discouraged and modification of ANY part of the ICT-101 will invalidate the warranty and is very likely to result in faulty test operation.

To remove the cover, turn the ICT over on its top and remove the four (4) screws; two (2) of which attach the bail-retaining rubber mounts. After removing the screws, carefully turn the ICT-101 right side up again and remove the lid by pulling on the corners while holding onto the bottom section of the case.

Installation procedure for Internal Options will accompany each option.

3. POWER-UP AND OPERATIONS

NOTE OF CAUTION: Unless absolutely necessary,
DO NOT disconnect the test cable attached to
the ICT-101 as it will bend or break the pins.

3.1 POWER-UP

Upon power-up, the ICT-101 executes an internal diagnostic. Should the self-diagnostic routine detect a problem in the unit, the ICT-101 will give off a beeping sound without any additional indication on the display. Should this occur, it is recommended that you switch the power off and start it up again after a one (1) to two (2) minute wait.

If the second try has the same result, then the unit is faulty and should be returned to Micro Sciences for repair (see Section 1.5 WARRANTY).

At the end of a successful self-diagnostic, a message is displayed asking for the user to disconnect the test clip from anything it may be attached to:

"TEST CLIP OFF/GO"

If the test clip is inadvertently attached to an IC and the "GO" button is depressed, a message will be displayed:

"INTERFACE BAD"

Please disconnect external active or passive elements from the test clip, turn off the power and start over with the self-diagnostic (see Section 3.1 POWER-UP, above). If the "INTERFACE BAD" condition persists:

- A. Check that the test cable is firmly attached to the ICT-101.
- B. The ICT-101 has internal interface problems. The unit is faulty and should be returned to Micro Sciences.

As soon as "TEST CLIP OFF/GO" is displayed and with the test clip still detached, press the "GO" button for the ICT-101 to perform a diagnostic on its inter-

for the ICT-101 to perform a diagnostic on its interface. Performance and termination of this routine is indicated by a rapid succession of displays:

"DIAGNOSTIC RUNNING"
"DIAGNOSTIC GOOD"
"TTL MODE SET" OR
"CMOS MODE SET"

The user can change from TTL to CMOS mode and back by pressing the "SELECT" button. However, the ICT-101 will test TTL or CMOS regardless of the mode it is in. (The "SELECT" button is provided to facilitate the RAM/ROM test function - see Section 4. OPTIONS).

Once the TTL or CMOS mode is set and the corresponding message is displayed on the unit, the ICT-101 is ready for test operation.

NOTE: If the EDP/1 or ROM/1 option hardware is attached, then the rapid succession of displays will be:

"DIAGNOSTIC RUNNING"
"DIAGNOSTIC GOOD"

E = RAM I = GO

At this point, the user may choose whether they want to use Internal Memory (standard operation) or to use External Memory (ICT-EDP/1 option).

To use the ICT-101 in its normal operation, just push the "GO" button. The unit will then display:

"TTL MODE SET" or
"CMOS MODE SET"

The user can change from TTL to CMOS mode and back by pressing the "SELECT" button. However, the ICT-101 will test TTL or CMOS regardless of the mode it is in. (The "SELECT" button is provided to facilitate the RAM/ROM test function - see 4. OPTIONS).

Once the TTL or CMOS mode is set and the corresponding message is displayed on the unit, the ICT-101 is ready for test operation.

If the operator wishes to reselect either from "INTERNAL TO EXTERNAL" or from "EXTERNAL TO INTERNAL", then the "RESET" button should be pushed. This will again display:

E = RAM I = GO

The user may again choose his option.

3.2 PREPARATION OF THE PC BOARD CONTAINING LOGIC IC'S TO BE TESTED

Before any testing commences, the test board should be subjected to a thorough visual inspection searching for non-IC problem sources; such as: broken leads, PCB anomalies, missing IC's, burn spots, etc.

Prior to testing the IC's on the board, two (2) conditions MUST be met:

- A. The PC board with logic IC's that are to be tested has to be powered up with a +5V power source against logic ground. (Excessive voltage ($> +6V$) may damage the unit and will void the ICT-101 warranty.)

Should the board under test require other than +5 Volts in normal operation, the power source has to be replaced with a 5 Volt source for the ICT-101 to work reliably. (Note that at the reduced voltage, the IC's to be tested will still be active.) The +5 Volts needs to be applied on the downside of any regulator on the PC board; the best place may be across a filter cap.

Should any board in normal operation require positive and negative voltage (e.g. -5V, -12V), the board should be connected to +5V on the positive circuits only. IC's then under power may be tested.

Care must be taken that the logic ground of the PC board is connected to the ground terminal of the ICT-101 (front plate) via the ground lead provided with the unit.

WARNING: The test clip should NOT be left on any IC under test for more than one (1) minute. Extensive application of +5 VDC

can weaken the IC.

- B. For proper testing of logic IC's, the board has to be in a static condition. In preparation for the test, the board has to be devoid of active IC's; such as: microprocessors or clock generators. Thus, active elements on the board have to be removed or effectively disabled; for example, by tieing the clock generating input to an appropriate level.

3.3 TEST OPERATION

After correct testing conditions have been assured on the board, the test clip can be connected to the logic IC to be tested. Note that the orientation of the test clip relative to the IC's pins is not relevant as long as contact is made to all pins. Upon depressing the "GO" button, the ICT-101 will proceed in rapid sequence as follows:

- A. Locates ground and VCC on the IC.
- B. Determines the orientation of the clip relative to the IC.
- C. Determines pin count.
- D. Compares IC specific responses to ICT-101 originating signals with response table in the ICT's Library (see Appendix 5.1 and 5.3).
- E. Displays the outcome of matching the IC's responses with programmed responses.

3.4 INTERPRETATION OF TEST RESULTS

Testing of logic IC's can result in alternative displays on the ICT-101's front panel; for example:

- A. "7402 GOOD" or "74C02 GOOD"

This message identifies the generic chip number and determines this chip to be "GOOD". When in the CMOS mode, the ICT-101 insets a "C" for CMOS in the standard (7400 series) part number. When in the TTL mode, the industry standard 7400 numbers are displayed.

B. "UNIDENTIFIED/BAD"

This message means that the chip's characteristics cannot be matched with that of a chip in the Library. This indicates that either:

1. The chip is bad OR
2. The chip is not in the Library OR
3. The chip is wired in the circuit board in such a way as to disguise its identity. Thus, the chip may or may not be in the Library OR it may or may not be good (see Section 3.6 IC MODE CONFIGURATIONS).

C. "CAN'T FIND GND"

The ICT-101 cannot find the ground lead. Thus either:

1. The test clip is not making contact with the ground pin OR
2. There is no connection from logic ground to the IC under test. Thus, insure that the test clip makes contact with all the pins of the IC under test and does not make contact with any other adjacent IC's or other components and also insure that the board under test is properly grounded and the test unit ground is connected.

D. "CAN'T FIND VCC"

Again insure that the clip contacts ALL leads. If it does, the power may not reach the IC or the IC is indeed bad. Be sure to check the +5V DC power source and/or location of the +5V DC test clip originating from the users power supply.

E. "7402 #2 NOOP" or "74C02 #2 NOOP"

The ICT-101 obtained enough information from the testing process to identify the IC. However, Gate #2, for example, is non-operating either by design or due to a bad IC.

F. "CAN'T LOCATE"

This message will occur when VCC and/or ground are located on non-standard pins. (Example: 7473, 7477, 7478). This type IC cannot be tested except with a special ICT-101 option.

G. "RAM TEST/ROM TEST INACTIVE"

Without the RAM/ROM Test Options installed (available from Micro Sciences), the ICT-101 in its standard configuration is unable to test memory chips. Thus, without the appropriate option installed in the ICT-101, the above message(s) will be displayed.

In summary, the ICT-101 never says "7402 BAD" because there are other conditions which can occur that will not allow the ICT-101 to identify a good IC.

Upon completion of the testing process, the results will be shown on the display for about three (3) seconds before the tester returns to the "TTL MODE SET" or "CMOS MODE SET" condition. The display can be retained by holding down the "GO" button. Alternatively, the test can be repeated.

3.5 ICT-101 LIMITATIONS

Extensive observation of the ICT-101's performance in a wide variety of testing conditions has indicated some limitations of the ICT-101's testing ability.

"UNIDENTIFIED/BAD" conditions will result if:

- A. Chip generated pulses are of extreme frequency or are of very short duration; for example: A 7474 wired as a one-shot, generates a pulse that the ICT-101 cannot see. Also, some counters wired in unusual configurations may test as "UNIDENTIFIED/BAD". If this condition is encountered routinely, contact Micro Sciences for clarification and/or custom programming.
- B. A diode is tied from an input pin of the IC to VCC or GROUND. The ICT-101 will identify these gates as "NOOP".

It should be noted that while the ICT-101 has tested a wide range of logic IC's, certain conditions may be presented to your tester which result in erroneous test messages. If the ICT-101 does not comprehend these conditions in the above exception, Micro Sciences may be consulted.

3.6 IC "MODE" CONFIGURATIONS

Many design engineers utilize certain multi-capability IC's to perform different tasks (non-standard outputs). Section 5.52 of this manual visually shows some of the many hundreds of special "MODE" configurations that are regularly used by PC board design engineers to accomplish the logic action (results) they need. Note the extra VCC and ground locations as well as pins tied together. The ICT-101 Standard Dictionary will identify the mode configurations shown in this appendix by displaying the IC and the correct mode.

Examples:	4013	Mode 26
	74240	Mode 4

Mode 1 is the standard IC configuration and will be shown as a regular IC rather than a mode.

3.7 TECH TIPS

Periodically, Micro Sciences, Inc. will issue "Tech Tips". These articles on actual ICT-101 user experiences should bring broader understanding of new test concepts and actual board test situations.

For future reference, we suggest that owners store their Tech Tip Bulletins in this section of the ICT-101 manual.

4. OPTIONS

The ICT-101 can only test static memory IC's. Devices with 24 Pins require an appropriate test cable. For information regarding option availability, delivery time and prices, please contact your nearest Micro Sciences' Representative.

Below are brief descriptions of various options that will be available for your expanded testing needs.

4.1 RAM/ROM OPTIONS

A. RAM TEST OPTION (ICT-RAM/1)

Includes programming of many industry standard static RAMS. These include 2114, 2115, 2142, 2147, 2148, 2167 or equivalent devices.

By pressing the "RAM" button, the "RAM TEST-SELECT" message is displayed. The RAM test to be performed is chosen by pressing the "SELECT" button until the required test program is displayed. When the proper test clip is attached to the RAM to be tested, the "GO" button is pressed.

The ICT-101 does a bit by bit or a byte by byte test. If the RAM is "BAD", the ICT displays the "RAM-NO GO". If the memory chip is "GOOD", the ICT displays "RAM CHECK GOOD". To exit the RAM test or another mode, press "RESET".

B. ROM TEST OPTION (ICT-ROM/1) ROM SOCKET-ADDITIONAL (ICT-ROM/SOK)

The maximum ROM density is 4K by 8 bits. Included in this option is a test for a standard 2716/2732 Pin-out ROM/PROM, the 24 Pin Test Clip and the EDP Option. The procedure for testing ROM's is the same as for RAM's, except that the "ROM" button is utilized. When the desired ROM test has been selected, a known good ROM is inserted in the socket; the test clip is attached to the ROM to be tested and the "GO" button is pressed. The ICT does a byte by byte comparison. Result displays are the same as for the RAM test.

NOTE: Address drivers to RAM or ROM under test may have to be disabled to insure proper testing.

4.2 EDP - SPECIAL BOARD TESTING

The External Dedicated Prom (EDP) options provides hardware and proms with test programming for SPECIFIC POPULAR printed circuit boards. (See M.S.I. EDP catalog.)

The EDP hardware consists of a plug and strap unit mounting a 24 Pin Zero Force (ZIF) Socket. The EDP 2732 Proms are programmed for each TTL/CMOS Digital IC as configured on the specific PC board. When the PC board under test is powered up and the appropriate test clip is attached to the IC to be tested, the ICT-EDP/1 will allow the ICT-101 to address the remote EDP and check for the proper response. If the IC is good, the display will read "7474 U12 OK". This indicates the logic correct IC number plus the board location(s) of the IC under test.

4.3 OBT - LOOSE IC TESTING

The ICT-OBT/4 Accessory provides a means for powering up loose IC's (14, 16, 20 and 24 Pin) and testing their logic functions. This provides for easy incoming quality control inspection as well as verifying good or bad for loose IC's to be inserted into repair printed circuit boards.

The OBT/4 comes with ZIF sockets for 14, 16, 20 and 24 Pin IC's, Off/On switch, Pin Size Selection switch and verification LED's, flat cable strap plug adaptable to the ICT-101 front panel J2 socket, 5V power and ground cable plug adaptable to the ICT-101 back panel.

4.4 DICTIONARY EXPANSION SERVICES

Micro Sciences offers updating services which can be subscribed to or ordered. These services update the Dictionary to comprehend popular new 14, 16, 20 and 24 Pin Digital Logic IC's that have appeared on the market.

A. ICT-CPS/1

This service allows ICT-101 users to send samples to Micro Sciences of good IC's that are not included in the standard Dictionary but which the customer wishes to have added to the Dictionary of HIS ICT-101 (using internal Eprom).

This service also allows customers to send their private PC boards for confidential programming similar to the EDP/1 option which then allows on-the board testing. (See 4.2 EDP - SPECIAL BOARD TESTING.)

B. ICT-EX204

This option provides an expansion of the Standard Dictionary to include high volume 20 and 24 Pin IC's (see Appendix 5.41). In order to install any of these options, Micro Sciences will forward a programmed ROM (E-PROM) with instructions for USER installation replacing the old (E-PROM). The old E-PROM must be returned to Micro Sciences for full credit.

C. ICT-EX205

This option provides an expansion of the standard Dictionary to include additional 14, 16, 20 and 24 Pin IC's (see Appendix 5.42).

D. ICT-EDP (EXTERNAL DEDICATED PROM)

The EDP Option (see Section 4.2 EDP - SPECIAL BOARD TESTING) allows for special board programming or for expanded dictionaries of IC programmed responses as an external rather than internal function (see 4.4 E. ICT-EL2001 below). This lowers test time required and provides for multiple external dictionary modules. EX204 and EX205 may be used in EDP/1 for faster test response time.

E. ICT-EL2001 (EXTERNAL LIBRARY - Available Mid '85)

This option allows periodic dictionary expansion modules to include testing of many new popular digital logic SSI and MSI chips. The option includes the standard ICT-EDP hardware plus special proms containing various IC programmed responses (see Section 3.3 TEST OPERATION).

4.5 ACCESSORIES/TEST CABLES

- A. 16 PIN TEST CABLE (ICT-16C)
- 20 PIN TEST CABLE (ICT-20C)
- 24 PIN TEST CABLE (ICT-24C)

The ICT-101 comes with 20 and 24 Pin Front Panel Sockets installed and a 20 Pin Test Cable and Clip. A 24 Pin Test Cable and Clip is available. A 16 Pin Test Cable and Clip is available (plugs into the 20 Pin Front Panel Socket). All test cables are three feet (3') long.

FREWOOD
DALLAS

5. APPENDICES

5.1 IC DICTIONARY APPENDIX

The ICT-101 tests various digital IC's relative to their logic function; therefore, it will test 7400, 74L00, 74LS00, 74ALS00, 74H00, 74HC00, 74S00 equally. If the IC's are good, the display will read: "7400 GOOD".

The ICT-101 also tests mil spec IC's with nomenclature as below:

DM5400	DM54L00J/883
DM5400J	DM54L00W/883
DM5400J/883	DM54LS00J
DM5400W/883	DM54LS00J/883
DM54ALS00J	DM54LS00W/883
DM54H00J	DM54S00J
DM54L00J	DM54S00J/883

JM38510/00104BCA/BCB/BDA/BDB

The IC's are all tested equally and if they are good, the display will read: "7400 GOOD". The ICT-101 does not distinguish between military and commercial operating nomenclatures, so "7400" will be displayed irrespective of the part number.

Section 5.5 has lists of IC's identified generically and by O.E.M. manufacturer's product description or function. For example:

7400	QUAD 2-INPUT NAND GATE	[G]
SN74LS10J	TRIPLE 3-INPUT NAND GATE	[M]

The next page shows many of the various nomenclature assigned to only one (1) IC; the 7474 flip flop.

G = GENERIC	M = MOTOROLA	N = NATIONAL SEMI
T = TX INSTRUMENTS	S = SIGNETICS	F = FAIRCHILD

5.11 7474 EXAMPLES:

The following IC numbers will all be tested under 7474 logic and if "GOOD", will be displayed "7474 GOOD".

Fairchild:

7474DC, 7474PC, 74F74DC, 74F74PC, 74H74DC,
74H74PC, 74LS74DC, 74LS74PC, 74S74DC, 74S74PC

5.2 MAINTENANCE AND SUPPORT SERVICES

The ICT-101 does not require regular maintenance. However, it is recommended that the unit is kept away from excessive heat and dust. All components used in all ICT-101's are of the highest commercial grade available. Furthermore, each ICT-101 is subject to a very rigid acceptance test program during and after assembly and prior to shipment. Nevertheless, as with all components and equipment, there could be a certain small percentage of failure. Contacts (clip, sockets) and displays may require cleaning on an as required basis.

In case of trouble with the unit, notify Micro Sciences (1-800-527-7141) for instructions. A return authorization number will be issued and will appear on all packing lists, correspondence and the shipping label. No return will be serviced without an authorization number.

Units for factory inspection should be shipped via prepaid freight to Micro Sciences, Inc., 1095 S. I-45, Hutchins, Texas 75141 (Attn: Receiving/Shipping).

Should the factory inspection determine that defects are covered under the warranty, the customer will receive credit for incoming freight expense and the return of repaired units will be at Micro Sciences' expense. Units will normally be reshipped from the factory within twelve (12) working days of receipt of the defective unit. Out of warranty units or units modified or abused by customers will be invoiced for parts and labor and will be returned at customer's expense within a reasonable time. Extensive care has been taken in designing, manufacturing and testing this unit. Proper use of this equipment will insure many years of satisfactory service.

5.4 OPTIONAL EXPANDED DICTIONARIES

EX204 (5.41) and EX205 (5.42) are internal expansions which may be accomplished by adding additional E-proms to the ICT-101 units CPU PC board at the appropriate socket.

EL2001 (5.43), EL2002, EL2003, etc. are External Library expansions which work in conjunction with the EDP (see Section 4.2) external hardware. These options are easily expandable and help cut down on testing time.

6. THEORY OF OPERATIONS

6.1 BLOCK DIAGRAM

The block diagram for the ICT-101 is shown in Figure 6.1 and is explained in detail in Section 6.3.

6.2 NOMENCLATURE

Logic levels will be specified as being either a Logic 0 or Logic 1.

FIGURE 6.1 ICT-101 BLOCK DIAGRAM

6.3 NSC800 MICRO PROCESSOR

The NSC800, U1, CPU provides an on chip oscillator which is driven by X1, a 2.4576 MHz oscillator. The clock circuitry divides this external frequency by two (2) and provides a square wave clock signal to the rest of the system at one-half ($\frac{1}{2}$) the input frequency. This clock signal, CLK, is the basic timing signal for all CPU operations.

6.31 NSC800 RESET

When power is applied to the ICT-101, a delay network composed of D1, R2 and C6 holds the NSC800 in a reset mode until the power supply voltage has stabilized. The gates of U2 further wave shape the power on transition. When the "RESET" button is pressed, the input of the Gate U7 on the Main PCB is grounded. The resistor capacitor on the input of the gate provides switch debounce. The output of U7 is inverted again at U2 on the microprocessor PCB. The output of U2 is fed to Pin 21 of NSC800 which generates a non-maskable interrupt. The firmware detects the interrupt and performs a soft reset.

6.32 RUN INDICATOR

There are two (2) status lines, Pins 27 and 29, which indicate the type of cycle the NSC800 is executing. These signals are OR'D together in U6 to produce the "RUN" indication on the front panel. When U6 is a Logic 1, Q1 on the display board is turned on and the "RUN" LED is illuminated.

6.33 NSC800 ADDRESSING

The NSC800 employs a multiplexed address and data bus scheme (see Figure 6.3) with low-order byte of the address being multiplexed with the 8-bit data bus.

FIGURE 6.3 NSC800 BUS STRUCTURE

6.4 ADDRESS DEMULTIPLEXER

The key signal in demultiplexing the information on the bus is the Address Latch Enable (ALE) signal. This signal provides gating and strobe information as to when the multiplexed AD(0-7) bus contains address information.

The ALE signal is inverted by U2 and is applied to the clock pin of the octal latch, U4. The address is latched on the trailing edge of the ALE signal to provide a standard non-multiplexed bus structure. Addresses are labeled AF through A0; most to least significant.

Three (3) other control signals are involved in a data access via the bus, a generalized read (RD) or write (WR) strobe plus a signal that indicates whether the access is to the memory or I/O space (IO/M).

With a memory addressing capacity of 64K bytes, all 16 bits of address information are used; the I/O capacity of 256 I/O ports only employs 8 bits of address with the I/O address present on both the high-order A(8-F) and low-order AD(0-7) bytes.

The timing for a basic read or write operation is shown in Figure 6.4.

FIGURE 6.4 NSC800 MEMORY READ AND WRITE CYCLE

6.5 MEMORY DECODE

The Memory Decode Logic is used to select the ROM's or RAM. The heart of the Decode Logic is U5, a 4 to 16 line decoder. The decoder is enabled when the following conditions are met:

- 1) The IO/M control line from NSC800 is a Logic 0 and
- 2) The output of U3 is a Logic 0 which resulted from the RD or WR inputs being a Logic 0.

NSC800 addresses AC through AF; select one (1) of sixteen (16) outputs when the enable conditons are met.

The outputs of the decoder are Logic 0 active. Outputs 1 through 6 are for selections of ROMS. Outputs 7 through 10 and 12 through 15 are reserved for future enhancements. Output 11 provides logic sequence se-

lection for either RAM, U14 or ROM, U13. RAM is selected by Decoder Output 11 and a Logic 1 on the address line AB. ROM is selected by Decoder Output 11 and a Logic 0 on address line AB. Decoder Output 16 used to select the EDP option.

Table 6.5 lists the NSC800 addresses and the corresponding ROM/RAM enabled.

TABLE 6.5
MEMORY MAP

NSC800 Address	Resignator Designator Enabled
0000H through 0FFFH	U7
1000H through 1FFFH	U8
2000H through 2FFFH	U9
3000H through 3FFFH	U10
4000H through 4FFFH	U11
5000H through 5FFFH	U12
A000H through A7FFFH	U13
A800H through AFFFH	U14

6.6 RAM/ROM

6.61 ROM

ROM U13 have NSC800 addresses A0 - AA connected to address pins. ROM U7 through U12 have NSC800 addresses A0 - AB connected to address pins. All ROM's have their outputs connected to Data Bus D0 through D7. The data from a memory location in a ROM is selected by a Logic 0 on the RD control line and Logic 0 on an output of the decoder.

6.62 RAM

RAM U14 have NSC800 addresses A0 - AA connected to address pins. RAM outputs are connected to Data Bus D0 through D7. The data from a memory location in the RAM is selected by a Logic 0 on Pins 18 and 20 of U14. To write data to the RAM, data on the data bus is written in the location selected by the address when Pins 18 and 20 are a Logic 0 and the WR control line is a Logic 0.

6.7 I/O DECODE

The I/O Decode is accomplished by using a 4 to 16 line decoder and associated qualifying logic. NSC800 addresses A6, A7 must be a Logic 1 and address A5 must be a Logic 0 for the enable at U5, Pin 19 to be a Logic 0. The other enable for U5 is a Logic 0 when the following conditions are met:

- 1) IO signal is Logic 1 and
- 2) RD or WR signal is a Logic 0.

The address lines select on output by forcing it to a Logic 0. Output 1 is used to read the status of the switches. Output 2 is used to activate the annicator. Output 3 through 5 are used to control the test device interface. Outputs 6, 7, 11 and 12 are reserved for future products. Outputs 8 through 10 are used to read data from the test device interface. Output 13 is used to control the LCD display. Output 14 is used to monitor the state of jumpers on the CPU board. Table 6.7 lists the NSC800 I/O addresses and the corresponding I/O devices that are enabled.

TABLE 6.7
I/O MAP

NSC800 I/O ADDRESS	MODE	DEVICE
COH	Input	Swit.
C2H	Input/Output	Ann
C4H	Output	Test Device I/F Channel E
C5H	Output	Test Device I/F Channel E
C6H	Output	Test Device I/F Channel F
C7H	Output	Test Device I/F Channel F
C8H	Output	Test Device I/F Channel G
C9H	Output	Test Device I/F Channel G
CEH	Input	Test Device I/F Channel E
DOH	Input	Test Device I/F Channel F
D2H	Input	Test Device I/F Channel G
D8H	Output	LCD Display
DAH	Input	Tests

6.8 JUMPER/SWITCH INPUTS

6.81 JUMPERS

The NSC800 Processor can read the state of the jumpers on the CPU board by placing the address ODAH on the address bus and executing an I/O read instruction.

6.82 SWITCH INPUTS

The NSC800 Processor can read the state of the switches on the front panel by placing the address OCOH on the address bus and executing an I/O read instruction. Each switch located on the front panel assembly is an SPST normally open switch. Upon closing the input to the Schmidt Trigger, U7 is grounded. The RC network on the input U7 is used for debounce purposes. The select "SEL" pushbutton is unique in that the output of U7 clocks the 7474, U6. The inverted output of U6 is connected to the D input. This causes the flip flop to toggle for every activation of the "SEL" key. The output of U6 is then sampled by the NSC800.

6.9 TEST DEVICE INTERFACE

The Test Device Interface connects the IC under test with the NSC800. The Interface provides a 24 bit channel labeled E0 through E7, F0 through F7 and G0 through G7 to the IC under test. Each channel is accessed as two (2) I/O addresses. Refer to Table 6.7 for the I/O address. Data from the 24 bit channel is monitored by the NSC800 through the octal bus buffers. U4-1 monitors the E section of the channel through the I/O address CEH. U12-1 monitors the F section of the channel through I/O address DOH. U12-2 monitors the G section of the channel through I/O address D2H. The operation of the Test Device Interface is proprietary and cannot be service separately.

6.10 ANNICKATOR

The Annicator, or beep, is started by performing an I/O write to address C2H. The selected output of the decoder is gated with the WR control line causing the

the flip flop, U6, to be clocked on the trailing edge of WR control line. After clocking the output of the flip flop goes to a Logic 0 forcing the output of the inverter U7 to a Logic 1. This action causes the transistor Q to turn on enabling the annicator. The beep is terminated by performing an I/O read to address C2H. The selected output of the decoder is gated with the RD control line. The gated output of U13 is connected clear input of U6 whose output is returned to the Logic 1 state. The outputs of U7 returns to the Logic 0 state and turns off Q1 and the annicator.

6.11 LCD INTERFACE

The LCD (Liquid Crystal Display) Interface contains four (4) sections. These are:

- 1) Display,
- 2) Display Controller U2,
- 3) Display Driver U3, U4 and
- 4) the Negative Voltage Supply U1.

6.111 DISPLAY

The LCD Display is organized as a sixteen (16) character display. Each character location is a 5 x 7 dot cell. All characters have common rows and each column is connected to a display driver.

6.112 DISPLAY CONTROLLER

The Display Controller is accessed by the NSC800 through I/O address D8H. Two (2) types of data are loaded into the controller. One (1) type of data is command and control information for the controllers. The other is data for the display. Table 6.111 is a list of codes sent to the Display Controller for initialization.

Table 6.112
LCD Display Controller Digitalization

DATA	FUNCTION
8BH	Reset Busy
70H	Reset Power Down Flag
6EH	Reset Rapid Load Flag
6DH	Reset Underline
6AH	Reset Cursor Visible Flag
68H	Reset Blank Display Flag
67H	Set Flag to Up
65H	Set Inc Flag
62H	Reset Blink Display
61H	Set Blink Cursor Flag
00H	Set Cursor to Leftmost Position
8AH	Clear Display

The display data is composed of ASCII data in the range of 20H to 5FH. The Display Controller produces an alternating voltage required for the display. Figure 6.112 shows typical waveforms for the row and column drivers.

FIGURE 6.112

The Display Controller also drives the first twelve (12) columns.

6.113 DISPLAY DRIVER

The Display Driver drives the other columns in the LCD display. Data for column information is passed from U2, Pin 16 to U3, Pin 2. The serial data out of U3, Pin 6 is connected to serial data input of U4, Pin 2. Serial data is clocked through the drivers from U2, Pin 15. The minus reference voltage is connected to the drivers from U2, Pin 17. The backplane driver for the column drivers is supplied on U2, Pin 19.

6.114 NEGATIVE VOLTAGE SUPPLY

The Negative Voltage Supply is composed of C3, C4, C5, RP1 and U1. The heart of the supply is U1 which contains a series DC power supply regulator, RC oscillator, voltage level translator and four (4) output power MOS switches. The oscillator, when unloaded, oscillates at a nominal frequency of 10 kHz. The mode of operation of the device may best be understood by considering Figure 6.114. Capacitor C4 is charged to a voltage VCC for the half cycle when S1 and S3 are closed. During the second half cycle of operation, switches S2 and S4 are closed, with S1 and S3 open; thereby, shifting capacitor C4 negatively by VCC volts. Charge is then transferred from C4 to C5 such that the voltage on C5 is exactly VCC assuming no load on C5.

FIGURE 6.114 IDEALIZED 7660

6.115 POWER SUPPLY

The Power Supply is regulated by IC2. The IC has an independent power supply composed of D1 and C2. This power supply delivers 22.5V to power IC1. Pin 6 provides a 7.15V reference. The reference output is connected to a divider network R5, VR2, R3 to provide a 2.5 volt re-to Pin 5 of IC1. The output Pins 10 of IC1 drives the base of Q1 which in turn drives the base of Q2. The emitter of Q2 supplies five (5) volts to the terminal stud through the current sense resistor, R8. R2, R4 and R10 provide a feedback look to IC1 to maintain regulation. R13, C4 are used to provide output filtering.

6.12 TROUBLESHOOTING GUIDE

6.121 EQUIPMENTS REQUIRED

The following equipment will be useful in troubleshooting the ICT-101.

- 1) Fluke 73 DVM or equivalent
- 2) Tektronix Model 2215A oscilloscope or equivalent
- 3) Micro Sciences, Inc. ICT-101 with EDP and EDP3003.

6.122 STANDARDS

All DC voltages should be within + or - 10% of the voltage specified.

A Logic 0 level is defined as a voltage between 0.V and .8 volt.

A Logic 1 level is defined as a voltage between 2.0V and 5.0 volts.

Input voltage of 120VAC.

6.123 PRELIMINARY TEST

Before the unit is disassembled for troubleshooting, test and replace, if necessary, the fuse, F1, on the rear panel. Test for 5.0V on the rear panel connectors. If no voltage is present, continue; otherwise, check the unit for operation and return the unit to service, if operable.

6.124 UNIT DISASSEMBLY

To prepare the unit for testing, disconnect the unit from the power. Remove the four (4) Phillip's head screws from the bottom. Gently remove the top half of the cabinet.

6.125 VISUAL INSPECTION

Visually inspect the unit for burned components or traces on the PCB's. Check the fuse located on the Main PCB and replace if defective. If the fuse is defective, check for a shorted condition, less than five (5) ohms of resistance, between +5V and GND connections of the power supply. The CPU and display PCB's can be isolated from the power by disconnecting the ribbon cable assemblies on the Main PCB. Remove and replace the faulty assembly.

6.126 INITIAL TESTING

Apply power to the ICT-101. CAUTION: There is 120 VAC power exposed when the unit is operation. Check and adjust the power supply, VR2, for a voltage of 5.0 VDC at the output of the power supply.

6.127 ADVANCED TROUBLESHOOTING

Verify that the NSC800 is running by either the illumination of the "READY" lamp on the front panel or the presents of clock signals on the CLK or ALE Pins of the NSC800. If none are present, check the crystal or NSC800 Processor. If the unit fails to operate, remove the NSC800 Processor and use the ICT-101 with EDP and EDP 3003 to check the devices. Check the CPU and Main PCB on a standalone basis.

6.128 STANDALONE DIAGNOSTICS

The Internal Diagnostic can be executed continuously on power up by connecting the jumper W4 located on the CPU PCB. Upon power up, the NSC800 tests the RAM memory. If the RAM memory is defective, the annicator will sound. The display is not initialized and random data will appear on it. If the memory section of the diagnostic passes, the display is cleared. The message "TEST CLIP OFF/GO" message appears.

The next message "DIAGNOSTIC" shortly appears after the first message.

The Test Device Interface is then exercised. If all the signal paths of the interface are verified, the message "DIAGNOSTIC GOOD" appears in the display. The annicator sounds after every message. If the Test Device Interface is defective, then the message "INTERFACE IS BAD" is displayed continuously. The Test Device Interface is tested by writing all Logic 0 to the Test I/F Bus and reading the bus. The Bus is also tested by writing a Logic 1 to the Test I/F Bus and reading the bus.

6.129 POWER SUPPLY TROUBLESHOOTING

CAUTION: Hazardous voltages appear on the Power Supply. Use caution in troubleshooting the Power Supply. For proper operation of the Power Supply, check for a supply voltage of 22 VDC at Pins 11 and 12 of IC1. Check for a reference voltage of 2.5 Volts at Pin 5 of IC1. Check for a raw supply to the collector of Q2 of 11 - 12 volts. Check for base drive on Q2. If no voltage appears on the output of the power supply, check SCR1 for either on or shorted condition. Also, check the current foldback for an on condition represented by a differential voltage between IC1 Pins 2 and 3 of .65 Volt or greater.

7.4 POWER SUPPLY PARTS LIST

ITEM	DESIGN	DESCRIPTION	SPECIFICATION	UL FILE	MANUFACTURER
1		PRINTED CIRCUIT BOARD	FR-4, 94V-0		YA HSIN INDUSTRIAL CO. LTD.
2	R1	CARBON FILM RESISTOR	2.2K OHM 1/4W +5%		SHING YA ELECTRIC WORK CO.
3	R2, R3, R4	PRECISION RESISTOR	2.21K OHM 1/4W +1%		FIRST ELECTRONIC CO. LTD.
4	R5	CARBON FILM RESISTOR	2.7K OHM 1/4W +5%		SHING YA ELECTRIC WORK CO.
5	R6	CARBON FILM RESISTOR	1.5K OHM 1/4W +5%		SHING YA ELECTRIC WORK CO.
6	R7	CARBON FILM RESISTOR	10 OHM ½W +5%		SHING YA ELECTRIC WORK CO.
7	R8	CEMENT RESISTOR	0.1 OHM 3W +10%		SHING YA ELECTRIC WORK CO.
8	R9	CARBON FILM RESISTOR	470 OHM 1/4W +5%		SHING YA ELECTRIC WORK CO.
9	R10, R11	CARBON FILM RESISTOR	6.8 OHM 1/4W +5%		SHING YA ELECTRIC WORK CO.
10	R12	CARBON FILM RESISTOR	4.7K OHM 1/4W +5%		SHING YA ELECTRIC WORK CO.
11	R13	CARBON FILM RESISTOR	110 OHM 1/4W +5%		SHING YA ELECTRIC WORK CO.
12	C1	ELECTROLYTIC CAPACITOR	10000UF 16V VENT TYPE		ELTAI ELECTRONIC CO. LTD.
13	C2	ELECTROLYTIC CAPACITOR	100UF 35V VENT TYPE		TEAPO ELECTRONIC CO. LTD.
14	C3	CERAMIC CAPACITOR	0.0033UF 50V		ELTAI ELECTRONIC CO. LTD.
15	C4	ELECTROLYTIC CAPACITOR	220UF 10V VENT TYPE		TEAPO ELECTRONIC CO. LTD.
16	C5	ELECTROLYTIC CAPACITOR	10UF 50V VENT TYPE		SUCCESS ELECTRONIC CO. LTD.
17	D1, D4, D7	RECTIFIER DIODE	1N4002 100V 1A		ELTAI ELECTRONIC CO. LTD.
18	D2, D3	RECTIFIER DIODE	1N5401, 50V 1A		TEAPO ELECTRONIC CO. LTD.
19	D5	ZENER DIODE	H26A 1L		TEAPO ELECTRONIC CO. LTD.
20	O1	TRANSISTOR	TIP41A		PRESIDENT ENTERPRISES CORP.
21	O2	TRANSISTOR	2N3055		PRESIDENT ENTERPRISES CORP.
22	10	INTEGRATED CIRCUIT	MC1723CP		MOTOROLA SEMICONDUCTOR LTD.
23		IO SOCKET	14P		TAIWAN MOLEX CORP.
24	SCR	SILICON CONTROL RECTIFIER	2N6395		TAG ELECTRONIC CO. LTD.
25	VR1	SEMI-FIXED RESISTOR	500 OHM ROUND		TAIWAN RIVER CO. LTD.
26	VR2	SEMI-FIXED RESISTOR	2K OHM ROUND		TAIWAN RIVER CO. LTD.
27		TERMINAL PIN			LIANG SHUNG ENTERPRISE CO. LTD.
28		INSULATION PAD			YUTO ENTERPRISE CO. LTD.
29		RIVET			LIANG SHUNG ENTERPRISE CO. LTD.
30		SILICON RUBBER INSULATOR	TD-3		SHIGMA INDUSTRY TAIWAN CO. LTD.
31		L BRACKET	ALUMINUM		TAIWAN ALUMINUM CORP.
32		SCREW	4 X 40 ISO ROUND HEAD		LIANG SHUNG ENTERPRISE CO. LTD.
33		SCREW	3 X 12 ISO ROUND HEAD		LIANG SHUNG ENTERPRISE CO. LTD.
34		SPRING WASHER	4MM		LIANG SHUNG ENTERPRISE CO. LTD.
35		WASHER	4MM		LIANG SHUNG ENTERPRISE CO. LTD.
36		SCREW NUT	4MM		LIANG SHUNG ENTERPRISE CO. LTD.
37		LOCKWASHER, EXTERNAL TOOTH	3MM		LIANG SHUNG ENTERPRISE CO. LTD.
38		TRANSFORMER			FHIHONG ENTERPRISE CO. LTD.
